Nucleic acids encoding 32 human secreted polypeptides, useful for preventing, diagnosing and/or treating e.g. cancers, Parkinson's disease and diabetic retinopathy

Claim 11; Fig 4; 890pp; English.

The present sequence is one of 32 novel human secreted polypeptides. The nucleic acid molecules and polypeptides may be used in the prevention, diagnosis and treatment of diseases such as immune disorders (e.g. multiple sclerosis, systemic lupus erythematosus and human immuno-deficiency virus (HIV) infections). Myperproliferative disorders (e.g. cancers and Gaucher's disease), cardiowyscular diseases (e.g. Scimitar syndrome, Chaga's cardiomyopathy and coronary arteriosclerosis), angiogenic disorders (e.g. corneal graft neovascularisation and diabetic retinopathy), neurological disorders (e.g. Huntington's chorea, Alzhelmer's disease and Parkinson's disease), infectious diseases and/or for promoting wound healing, regeneration and/or chemotaxis. The nucleic acid molecules may be used to produce the secreted polypeptides. They may also be used as DNA probes in diagnostic assays to defect and quantitate the presence of similar nucleic acid sequences in samples. The polypeptides may be used as antigens in the production of antibodies and in assays to identify modulators of their expression and activity.

```
The present invention provides human cDNAs, proteins and related genomic DNAs. These can be used in the treatment of neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal and proliferative disorders and inflammation. The present sequence is a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated nucleic acid molecule encoding an inflammation-associated polypeptide is used in preventing, treating or ameliorating a medical condition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 11; SEQ ID NO: 554; 859pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Barash SC, Ruben SM;

Partial TANGO-128, 140, 197, 212, 24, 239 sequences are useful in forensic biology, for diagnostic assays, prognostic assays, pharmacogenomics and for monitoring clinical trials. TANGO polypeptides are suitable for both prophylactic and therapeutic methods for treating a subject at risk of a disorder or having a disorder associated with aberrant TANGO expression. A wide range

that share sequence similarity with animal proteins having the property that spreads. MIRS are expressed in human cell lines, pituitary, lymph nodes, prostrate, testis, adrenal gland, uterus, foetal kindey, foetal lung and gene trapped human cells. MFPs are thrombospondins useful for treating abloagical disorders involving anglogenesis, cancer and development and probe for screening applications. MFPs are useful as a hybridisation probe for screening libraries, assessing gene expression patterns and also in gene therapy. Proteins having thrombospondin repeats act as receptors, secreted extracellular matrix proteins and proteases. The present sequence is novel human protein (MFP).

used to determine the presence or predisposition to a disease associated with altered levels of NOV-X. NOV-X, its DNA and its antibody are used to treated to prevent a pathology associated with NOV-X. The pathology associated with NOV-X. The pathological states that can be treated or prevented a heamatopoietic, cancer, immunological, tumour, neurodegenerative (e.g. Alzheimer's and Fartility disorders. NOV-X and its DNA are used in pharmacogenenics for predictive medicine. NOV-X and its DNA are used in pharmacogenenics for predictive medicine. NOV-X but is used in gene therapy. The present sequence is human novel KIRA1233-like protein, NOV-2a. NOV-2a gene is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to novel human polypeptides referred as NOV-X and their corresponding nucleic acid sequences. NOV-X collectively include NOV-1, NOV-2a and NOV-3b which are novel KIAA1233-like polypeptides, NOV-3b, NOV-3b, NOV-3b, NOV-3d which are novel STE20-like polypeptides and NOV-4a, NOV-4b, NOV-4c, NOV-4d and NOV-4e which are novel trypsin inhibitor-like polypeptides. NOV-X is used to identify a potential therapeutic agent that can modulate its activity and can be used for treating a pathology related to aberrant expression or aberrant physiological interactions of NOV-X or its DNA is
                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated KIAA1233-like, STE20-like, or trypsin inhibitor-like polypeptide for diagnosing and treating pathological disorders, such as Parkinson's disease and for use in pharmacogenomics -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             363

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to novel human polynuclectides encoding proteins that share sequence similarity with animal proteins having thrombospondin repeats. NHPs are expressed in human cell lines, pituitary, lymph nodes, prostrate, testis, adrenal gland, uterus, foetal kidney, foetal lung and gene trapped human cells. NHPs are thrombospondins useful for treating biological disorders involving angiogenesis, cancer and development and also in pharmacogenomic applications. NHPs are useful as a hybridisation probe for screening libraries, assessing gene expression patterns and also in gene therapy. Proteins having thrombospondin repeats act as receptors, secreted extracellular matrix proteins and prosent sequence is novel human protein (NHP).

be used in gene therapy. HSPPS can be used to treat or prevent disorders associated with decreased activity or function of HSPP. Antagonists of HSPP are used to treat or prevent disorders associated with increased activity or function of HSPP. Such diseases include cell proliferation cativity or function of HSPP. Such diseases include cell proliferation of HSPP such diseases include cell proliferation cardiouscular, neurological, reproductive or developmental disorders, (e.g. arteriosslerosis, cirrhosis, psoriasis, acquired immune deficiency syndrome, anaemia, asthma, Crohn's disease, Microbial or other infections, congestive or ischaemic heart disease, Alzheimer's, Parkinson's or Huntington's diseases, schizophrenia, ovulatory defects, muscular dystrophy). HSPP nucleic acids can be used for the recombinant production of HSPP, for detecting HSPP in standard hybridisation and amplification assays (for diagnosis and monitoring), in gene therapy, as antisense, triplex-forming or ribozyme therapeutics, for detecting related sequences or genetic variations, and for chromosomal mapping. HSPP are also used to antagonists (potential therapeutic agents). Ab are used to diagnose, or monitor, HSPP-related diseases (in usual immunoassays), as therapeutic cantagonists, in competitive drug screens, and for purification of HSPP (company) and for purification of HSPP) and antagonists, in competitive drug screens, and for purification of HSPP (company) and for purification of HSPP) and antagonists, in competitive drug screens, and for purification of HSPP (company) and for purification of HSPP) and antagonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       human signal peptide-containing proteins HSPP-1 to HSPP-134. HSPPs have anticancer, anti-inflammatory, antimicrobial, nootropic, hepatotropic, neuroprotective, cardiovascular and antiasthmatic activities, and can

The present invention provides human cDNAs, proteins and related genomic DNAs. These can be used in the treatment of neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal and proliferative disorders and inflammation. The present sequence is a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RISPVILSPHKHVSGFSSSLRISSIGDAGGGSRRPHRKPTILRKISAAOQLSASEVVTHL 1185

                                                                                                                           The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. AAZ33891 to AAZ34338, and AAX41685 to AAX41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present
                                                         secreted and transmembrane polypeptides and their polynucleotides, ful for treating blood coagulation disorders, cancers and cellular

```
detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation or differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, lung, colon, breast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders.

AAC78458 to AAC78599 represent polynucleotide and EST (expressed sequence tag) sequences which encode secreted or transmembrane PRO polypeptides. The PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bloactive molecules to cells and for modulating biological activities of cells, using the polypeptides for specific targeting. The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide pairs provide specific targeting of bloactive molecules to cells. AAC78600 to AAC78987 represent PCR primers and probes used in 61 LSSKSCEGRNIRYRTCSNVDCPPEAGDFRAQQCSAHNDVKHHGQFYEWLPVSNDPDNPCS 120 Novel PRO polypeptides and polynucleotides used in detection methods, to target bioactive molecules to specific cells, and to modulate cellular activities -Gaps 1 MECCRRATPGTLLLFLAFLLLSSRTARSEEDRDGLWDAWGPWSFCSRTCGGGASYSLRRC 60 Ferrara N, Filvaroff E, Fong S, Gao W, Gerber H, Gerritsen ME; Goddard A, Godowski PJ, Grimaldi CJ, Gurney AL, Hillan KJ; KIjavin IJ, Kuo SS, Napier MA, Pan J, Paoni NF, Roy MA; Shelton DL, Stewart TA, Tumas D, Williams PM, Wood WI; ; Botstein D, Desnoyers L, Eaton DL; Fong S, Gao W, Gerber H, Gerritse Length 525; Indels the isolation of the PRO polynucleotide sequences. 30.3%; Score 2907; DB 21; 99.4%; Pred. ö
with inappropriate ADAMTS-N expression. Disorders that may be treated using the nucleic acids, proteins and antibodies include, for example tumour cachexia, inflammation, dermatosparaxis in cattle or Ehlers-Danlos syndrome type VIIC (EDS-VIIC) in humans, erosion of articular cartilage in arthritic (both inflammatory and non-inflammatory) disease, and anglogenesis, tumour growth and metastases, and they may also be used for controlling embryogenesis and implantation of fertilised eggs. The present sequence represents human ADAMTS-RI.

The invention relates to novel human polynucleotides encoding proteins that share sequence similarity with animal proteins having thrombospondin repeats. Nies are expressed in human cell lines, pituitary, lymph nodes, prostrate, testis, adrenal gland, uterus, foetal kidney, foetal lung and gene trapped human cells. NHPs are thrombospondins useful for treating biological disorders involving anglogenesis, cancer and development and also in pharmacogenomic applications. NHPs are useful as a hybridisation probe for screening libraries, assessing gene expression patterns and also in gene therapy. Proteins having thrombospondin repeats act as receptors, secreted extracellular matrix proteins and proteases. The present sequence is novel human protein (NHP).

The present sequence is one of 32 novel human secreted polypeptides. The nucleic acid molecules and polypeptides may be used in the prevention, diagnosis and treatment of diseases such as immune disorders (e.g. diagnosis, systemic lupus erythematosus and human immuno-deficiency virus (HIV) infections), hyperproliferative disorders (e.g. cancers and Gaucher's disease), cardiovascular diseases (e.g. Scimitar syndrome, Chaga's cardiomyopathy and coronary arteriosclerosis), andiogenic disorders (e.g. corneal graft neovascularisation and diabetic retinopathy), neurological disorders (e.g. Huntington's foreca, Alzheimer's disease and Parkinson's disease), infectious diseases and/or for promoting wound healing, regeneration and/or for promoting wound healing, regeneration and/or chemotaxis. The nucleic acid molecules may be used to produce the secreted polypeptides. They may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples. The polypeptides may be used as antigens in the procure of acid molecules may be used as antigens in the procure of acid molecules may be used as antigens of the procure of acid molecules may be used as antigens of the procure of acid molecules may be used as antigens of the procure of acid molecules may be used as antigens of the procure of acid molecules may be used as antigens of the procure of acid molecules may be used as antigens of the procure of acid molecules may be used as antigens of the procure of acid molecules may be used as antigens of the procure of acid molecules may be used as antigens of the procure of acid molecules may be used as antigens of the procure of acid molecules may be used as antigens of the procure of acid molecules may be used as antigens of the procure of acid molecules may be used as antigens of the procure of acid molecules may be used as antigens of the procure of acid molecules may be used as antigens of the procure of acid molecules may acid acid molecules may be used as antigens

During sequence assembly data is compared from overlapping of lones. Where differences are found these are annotated as variations of responding to the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality) as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw.; SWISSPROT; Tr., TREMBL; WP.; WORMPEP; Information on the WORMPEP HILP://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chrome Further information.

the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Features listing.

## ANNOTATION OF FEATURES:

STSs are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and

local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST (W.C. Acids Res. 25:3389-3402) similarity (expect ( le-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence. continuity across the splice junctions. Sequences that are not identical matches are annotated as similar. SEQUENCING READ COVERAGE:Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.

QUALITY OF INDIVIDUAL BASES:This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found at URL: http://gc.bcm.tmc.edu:8088/quality.info/genbank.annotation.
